

ABSTRACT

A method for assembling a motor vehicle door includes the steps of affixing a
5 plurality of hardware components to a secondary trim component to form a door
module assembly. The door module assembly is attached to the structural door body.
A trim panel is secured to the structural door body overlaying the door module
assembly. The secondary trim component has a map pocket wall and the trim panel
has a map pocket opening. When the trim panel overlays the secondary trim
10 component, the trim panel cooperates with the secondary trim component to define a
map pocket.
